**RE: Report of Groundwater Monitoring Activities – December 2012  
City of Bozeman Sanitary Landfill  
Bozeman, Montana**

Dear Dustin:

Enclosed is the above referenced report. Please contact me with any questions or comments to this report or project.

We appreciate the opportunity to work with the City of Bozeman on this project.

Sincerely,

A handwritten signature in blue ink that reads "Mark F. Pearson".

Mark F. Pearson  
Project Manager

### APPENDIX C: GROUNDWATER SAMPLING LOGS

### APPENDIX D: LABORATORY ANALYTICAL REPORT

### APPENDIX E: STATISTICAL EVALUATION DATA AND WORKSHEETS

## 1.0 INTRODUCTION

This report presents the results of groundwater monitoring activities for December 2012 at the City of Bozeman Sanitary Landfill (**Figure 1, Appendix A**). Tetra Tech personnel conducted the monitoring in accordance with a Task Order for conducting the December 2012 and June 2013 monitoring events dated November 9, 2012 and the *Groundwater Sampling and Analysis Plan* dated October 28, 2010. The task order was approved by the City of Bozeman on December 3, 2012.

Monitoring activities included the measurement of water levels, field parameters, and sampling of wells and a surface water spring (McIlhattan Seep). Monitoring sites are shown in **Figure 2 (Appendix A)**.

### 1.1 METHODS

This section describes methods used to monitor groundwater at the Bozeman Sanitary Landfill. Results of the monitoring activities are presented in Section 2.0. Figures presenting the site location, monitoring sites, and other site aspects are contained in **Appendix A**. Data tables are contained in **Appendix B**.

Prior to this monitoring event, the Department of Environmental Quality (DEQ) approved of a decreased monitoring scope and metals analysis. Therefore, on November 28, 2012, DEQ approved the following decreases in the frequency of monitoring:

- Wells MW-7B, MW-8B, and MW-9B would be reduced to once every 3 years.
- Well MW-14 would be reduced to once every year.
- Wells MW-6B, MW-8C, and MW-16 need 4 independent samples (minimum semi-annually) collected before a change in future monitoring schedules would be considered.

On November 28, 2012, DEQ provided a one-time approval to drop analysis of metal constituents in wells: MW-4, MW-7A, MW-9A, MW-10, MW-11, MW-12, and McIlhattan Seep station.

#### 1.1.1 Water Level and Field Parameter Measurements

Depth to groundwater was measured in each monitoring well during the monitoring event. Water levels were measured from a designated measuring point on the north quadrant of the polyvinyl chloride (PVC) collar of each well. An electric well probe was used for water level measurements and routinely decontaminated before use at each well. Other field parameter measurements, including temperature, pH, specific conductivity, dissolved oxygen (DO), and oxidation reduction potential (ORP) were measured with a YSI®-556 multimeter in samples collected from the monitoring wells during purging; in purge water during pumping of wells; or downhole, in most of the wells following purging with a bailer. In the case of McIlhattan Spring, the multiprobe was completely submerged in the spring flow at the sampling location. The measurements were recorded on groundwater sampling logs included in **Appendix C**.

#### 1.1.2 Groundwater Monitoring

The December 2012 monitoring event was an assessment groundwater monitoring event and consisted of groundwater samples being collected from 15 monitoring wells (LF-2, LF-3, MW-4,

MW-5, MW-6, MW-6B, MW-7A, MW-8A, MW-9A, MW-10, MW-11, MW-12, MW-13, MW-15, and MW-16), the McIlhattan Seep, and Valley View (formerly McIlhattan) Veterinary Clinic (Vet) well. In addition, samples were collected from the water supply well: Landfill Shop Well (shop well). Well and other sampling locations are shown in **Figure 2**.

Samples collected from these locations were analyzed for VOCs and inorganic parameters listed in Appendix I to 40 CFR Part 258 contained in ARM 17.50.1306(7). The analytical lists are included with the laboratory analytical report in **Appendix D**. DEQ had previously approved omissions and additions of constituents to the Appendix I list. These include the omission of antimony, beryllium, and mercury and the addition of iron, manganese, and dichlorodifluoromethane. Therefore, all of the wells and sample sites were analyzed for VOCs, iron and manganese, and inorganic parameters with exception to wells LF-2 (VOCs and nitrate+nitrite as N), MW-16 (VOCs), and the shop well (VOCs).

Pace Analytical Services, Inc. (Pace), in Billings, Montana was contracted to furnish the sample containers, a trip blank, and conduct the analysis. The trip blank was prepared in Pace's Billings laboratory and consisted of de-ionized water. Upon Pace's receipt of the samples, the trip blank was analyzed for VOCs (8260 method) listed in Appendix I to 40 CFR Part 258 contained in ARM 17.50.1306(7) plus dichlorodifluoromethane. A duplicate sample was also collected at well MW-13 and submitted for analysis of VOCs, iron and manganese, and inorganic parameters.

Water samples were collected from each monitoring well in accordance with the *Groundwater Monitoring Sampling and Analysis Plan* for the site (Tetra Tech 2010). In general, the following sampling procedures were used:

- Monitoring wells were purged using either dedicated submersible pump(s), decontaminated submersible pumps with disposable tubing, or dedicated and/or disposable polyethylene bailers.
- A minimum of three well casing volumes were removed in wells that had suitable recovery, with the objective of sampling "formation" water. In wells with poor recovery, an effort was made to purge to a casing water column that was less than the length of a bailer and then allow the well to recover for sampling and subsequent monitoring (if DO and ORP was being measured downhole).
- Each sample obtained for dissolved metals analysis was filtered in the field through a disposable 0.45-micron filter. The samples were filtered directly from the dedicated (or disposable) bailer or pump discharge hose into appropriate labeled containers and preserved with nitric acid.
- All other samples were transferred into appropriate labeled containers and preserved, as necessary.
- Pertinent information (sample date, time, well location, personnel, etc.) was recorded on groundwater monitoring logs. These forms are included in **Appendix C**.
- Samples were packed in ice-filled coolers and shipped with chain-of-custody forms to Pace Analytical Services, Inc., in Billings, Montana. Chain-of-custody forms for the sampling events are included with the laboratory reports in **Appendix D**.

- Monitoring activities at the McIlhattan Seep (**Figure 2**) consisted of directly filling the sample bottles where the seep emanates at ground surface. Consistent with previous monitoring events, dissolved metals analysis had been selected at this location to provide for direct comparison with other monitoring locations' dissolved metals analysis. The sample for dissolved metals analysis was collected in a disposable bailer, filtered, and preserved with nitric acid. All other samples were collected in appropriate labeled containers and preserved, as necessary.
- Monitoring activities at the water supply well located at Valley View Veterinary Hospital on 2717 McIlhattan Road (formerly McIlhattan Veterinary Clinic) consisted of purging the well through a faucet in the kennel adjacent to the office. Approximately 90 gallons were purged prior to collecting a sample. The purging method and volume purged was consistent with previous monitoring events. As in previous monitoring events, the sample for metals was not filtered for reporting as total recoverable metals concentrations. All other samples were collected in appropriate labeled containers and preserved, as necessary.

The December 2012 monitoring event field parameter measurements and laboratory analytical results were entered into Tetra Tech's database management system. Data entries were then checked by Tetra Tech personnel to ensure correct data entry.

## 2.0 DATA PRESENTATION AND ANALYSIS

Data collected at the City of Bozeman Sanitary Landfill during the December 2012 monitoring event are summarized in this section. Figures and tables cited in the report are contained in **Appendix A** and **B**, respectively. Groundwater sampling logs, chain-of-custody documents, and laboratory analytical reports for the monitoring events are contained in **Appendices C** and **D**, respectively.

### 2.1 GROUNDWATER OCCURRENCE AND MOVEMENT

Groundwater occurrence, movement, hydraulic gradient, and other groundwater aspects are discussed. A groundwater flow and gradient map representing the December 2012 groundwater elevations is presented in **Figure 3**.

#### ***Site Groundwater Flow Direction and Hydraulic Gradient***

The December 2012 water levels at the landfill were generally consistent with groundwater elevations measured in previous December monitoring events and indicate a southwest groundwater flow beneath the *Unlined Closed Cell* shifting to a west-southwest flow between the *Lined Closed Cell* and well MW-10, at the western margin of the site. The groundwater gradient beneath the *Unlined Closed Cell* is a consistent 5.4% between wells MW-15 and MW-12. The groundwater gradient decreases between wells MW-12 and MW-4 to approximately 1.7 to 2.2% and then steepens again to approximately 4.2% between wells MW-4 and MW-10. In the vicinity of well MW-10, groundwater gradient is inferred to significantly decrease as indicated by topography in the vicinity of this well, near-surface groundwater level at this location, and its proximity with the East Gallatin River (**Figure 3**).

In addition to map hydraulic gradients mentioned above, the measurement of groundwater elevations in monitoring wells determined the following vertical groundwater gradients at the site:

- MW-6 and 6B      The groundwater elevation in well MW-6B is 12 feet higher than in well MW-6 indicating a distinct upward hydraulic gradient between groundwater at screened depths (below ground surface) of approximately 41 to 56 feet (MW-6) and 90 to 100 feet (MW-6B).
- MW-7A and 7B      As observed in previous monitoring events, groundwater elevations are the same in both wells indicating no upward or downward gradients in groundwater to approximately 74 feet depth (below ground surface).
- MW-8A, 8B, and 8C      The groundwater elevation in well MW-8C is approximately 4 feet higher than in well MW-8A indicating an upward hydraulic gradient groundwater at depths of approximately 41 to 70 feet (MW-8A and 8B) and 93 to 103 feet (MW-8C). As observed in previous monitoring events, groundwater elevations in wells MW-8A and 8B are the same indicating no upward or downward gradients in groundwater to approximately 70 feet depth.
- MW-9A and 9B      As observed in previous monitoring events, groundwater elevations are the same in both wells indicating no upward or downward gradients in groundwater to approximately 57 feet depth.

### ***Hydraulic Conductivity and Groundwater Movement***

Hydraulic conductivities of the alluvial fan deposits underlying the site had been evaluated in 1994 using a short-term aquifer test and laboratory hydraulic conductivity tests (Huntingdon, 1994). Results of these tests indicate hydraulic conductivity ranging between 97 centimeters per second (cm/sec) and  $5.2 \times 10^{-6}$  cm/sec. The relatively wide range of hydraulic conductivity values is indicative of a heterogeneous nature of the alluvial fan deposits. The average calculated hydraulic conductivity of the alluvial fan sediments is approximately  $2.0 \times 10^{-2}$  cm/sec (56.7 feet per day). This is a typical hydraulic conductivity value for clean sand (Freeze and Cherry, 1979). Assuming an effective porosity of 0.35 (typical values for sand and gravel range from 0.28 to 0.39; Todd, 1980) and map hydraulic gradients ranging from 1.7% to 5.4%, the approximate rate of groundwater movement beneath the Bozeman Landfill ranges between 2.8 and 9.1 feet per day.

## **2.2 GROUNDWATER QUALITY**

A discussion of the December 2012 results for analyses of inorganic parameters and volatile organic compounds is presented in the following sections. The Groundwater Protection Standard (GPS) is the concentration of constituents in site upgradient wells MW-5 and MW-15 and/or equal to the United States Environmental Protection Agency (USEPA) Maximum Contaminant Level (MCL) or the Montana Human Health Standard (HHS) cited in Circular DEQ-7 Montana Numeric Water Quality Standards (DEQ 2012).

### **2.2.1 Inorganic Groundwater Quality**

Montana landfill inorganic parameters include chloride, sulfate, electrical conductivity, pH, nitrate+nitrite, and up to 15 metals. Metal concentrations in samples collected from monitoring wells during the December 2012 were generally near or below the practical quantitation limit (PQL) and this is consistent with previous monitoring events. With exception to nitrate+nitrite as N and iron, inorganic constituent concentrations in wells did not meet or exceed the regulatory standards. Sites where metal concentrations were higher than the analytical reporting limit (RL) or of note are listed below:

- The nitrate+nitrite as N concentrations ranged between non-detection to 16 milligrams per liter (mg/L). The nitrate+nitrite as N concentration in well MW-8A was 16 mg/L and exceeded the GPS or MCL for nitrate+nitrite as N of 10 mg/L (DEQ 2012). Well MW-8C had nitrate+nitrite as N concentration of 5.8 mg/L.
- Iron concentrations ranged between non-detection to 3.6 mg/L. Iron concentrations in wells MW-10 and MW-12 were the highest (2.8 and 3.6 mg/L, respectively). There is no longer a human health guideline for iron (DEQ 2012).
- Manganese concentrations ranged between non-detection to 4.2 mg/L. Manganese concentrations in wells MW-10, MW-12, and MW-13 were the highest (0.1 to 4.2). There is no longer a human health guideline for manganese (DEQ 2012).
- Chloride concentrations ranged between 1.8 and 70.4 mg/L.
- Sulfate concentrations ranged between 4.3 and 111 mg/L.

## 2.2.2 Organic Groundwater Quality

**Table 2** summarizes concentrations of selected VOCs in monitoring events. Wells or sites with concentrations of tetrachloroethene and/or trichloroethene included wells LF-2, LF-3, MW-4, MW-6, MW-7A, MW-8A, MW-9A, MW-11, MW-12, MW-13, MW-16, shop well, and the McIhattan Seep. Tetrachloroethene concentrations ranged between non-detection and 7.7 micrograms per liter ( $\mu\text{g}/\text{L}$ , well MW-7A). Trichloroethene concentrations ranged between non-detection and 2.1  $\mu\text{g}/\text{L}$  (shop well). Wells or sites with concentrations of vinyl chloride included wells MW-6, MW-7A, MW-12, and MW-13 where concentrations ranged between 1.5 and 21.2  $\mu\text{g}/\text{L}$ .

Tetrachloroethene (in well MW-7A) and vinyl chloride (in wells MW-6, MW-7A MW-12, and MW-13) were the only VOCs detected above the GPS during the December 2012 monitoring event. The GPS for tetrachloroethene is 5  $\mu\text{g}/\text{L}$ . The United States Environmental Protection Agency (USEPA) GPS for vinyl chloride is 2  $\mu\text{g}/\text{L}$ . However, Montana has a lower GPS (also known as the Human Health Standard) for vinyl chloride, 0.2  $\mu\text{g}/\text{L}$  (DEQ 2012).

## 3.0 DATA VALIDATION

This section describes the data validation process used to determine the adequacy and quality of laboratory analytical data from the December 2012 monitoring event at the Bozeman Sanitary Landfill. The objective of data validation is to identify any unreliable or invalid laboratory measurements and qualify that data for interpretive use. These validations are performed according to guidelines prepared by U.S. EPA (1994a and 1994b).

### 3.1 FIELD QA/QC

A duplicate sample was collected from well MW-13 during the December 2012 monitoring event. The sample was labeled "Dup" and shipped to Pace Analytical Services, Inc., in Billings, Montana for analysis of VOCs and inorganic parameters listed in ARM 17.50.1306 plus dichlorodifluoromethane. A trip blank also accompanied the groundwater samples collected in December 2012. The trip blank was labeled "Trip Blank", and consisted of deionized water containerized by the laboratory, shipped to Tetra Tech's Bozeman, Montana office with the sample containers, and shipped back to the laboratory with the samples upon conclusion of the

field activities. The trip blank was analyzed for all VOCs listed in ARM 17.50.1306 plus dichlorodifluoromethane.

Field duplicate results aid in the assessment of sampling and analytical precision. Analytical results for the natural and duplicate samples collected from McIIhattan Seep were evaluated using the following criteria:

- The Relative Percent Difference (RPD) between the two samples was calculated when both values of the natural/duplicate pair were greater than five times the Minimum Detection Limit (MDL) for a given analyte.
- The Absolute Value Difference (AVD) between the natural and duplicate sample for a given analyte was calculated when one or both values were less than five times the MDL.

RPDs are calculated by dividing the difference between the two reported values for a given parameter by the average of the two parameters. Analytical results of parameters where the RPD was greater than 20 percent are considered estimated concentrations. Analytical results between the natural and duplicate samples collected from well MW-13 had no RPDs greater than 20 percent.

AVDs are calculated by subtracting the results of the two reported values for a given parameter. If the difference exceeds the MDL, then results for this parameter are considered estimated. Analytical results between the natural and duplicate samples collected from well MW-13 had AVDs greater than the MDL.

All trip blank results were evaluated using the following criteria:

- Analytical results of the trip blank sample were reviewed to determine if any parameter was measured in the sample at detectable concentrations. No VOCs were detected in the December 2012 trip blank.
- For detected constituents, all results greater than the MDL but less than five times the concentration of the detected constituent are considered estimated and are likely biased towards the high end.
- The following constituents are common laboratory contaminants and are considered estimated when results are greater than the MDL but less than 10 times the concentration in the contaminated blank:
  - Methylene chloride
  - Acetone
  - 2-butanone

### **3.2 LABORATORY QA/QC**

Pace Analytical received groundwater samples collected from the City of Bozeman Sanitary Landfill on December 7, 2012. Chain-of-custody documents accompanied the samples from collection to receipt at the laboratory. The pH was measured in all bottles upon receipt or before analysis to assure proper field preservation techniques were used. All samples were properly preserved and all samples were analyzed within the respective holding time for each analyte. The

quality assurance coordinator at Pace Analytical reviewed calibration standards, calibration verification, laboratory controls, laboratory duplicates, and laboratory spikes on a daily basis.

Review of all other laboratory quality assurance indicators showed all inorganic and organic analyses were in compliance with published QA/QC criteria and within the laboratory precision and accuracy guidelines with the exception of pH method SM 4500-H+B, where analysis was initiated more than 15 minutes after sample collection. System performance checks were also performed to evaluate proper system performance and calibration for VOC and semi-volatile analyses. All data indicate the GC/MS system was performing properly.

#### **4.0 STATISTICAL ANALYSIS OF WATER QUALITY DATA**

The City of Bozeman completed a corrective measures assessment for the Bozeman Sanitary Landfill in August 1995. A landfill gas extraction system was installed as a result, and has been operated at the site since December 1997 (Maxim, 2000). According to ARM 17.50.1310(5)(b), remedies selected as a result of the corrective measures assessment are considered complete when concentrations of all parameters listed in ARM 17.50.1307 have not exceeded the GPS for a period of three consecutive years based on statistical analysis of the data.

Of those parameters listed in ARM 17.50.1307, the following parameters have equaled or exceeded the Groundwater Protection Standard at the Bozeman Sanitary Landfill on at least a single occasion since 2005:

- Nitrate+Nitrite as N
- Tetrachloroethene
- Trichloroethene
- Vinyl Chloride

These parameters were statistically evaluated to determine which are present at statistically significant concentrations above enforcement standards. Selection and description of the statistical tests employed are described below, as are the results.

There are two point-of-compliance (POC) wells downgradient of the closed *Unlined Cell* and these are wells MW-6 and MW-8A (**Figure 2**). The upgradient wells are MW-5 and MW-15.

In consideration of vinyl chloride concentrations in well MW-6 and MW-7A, statistics was conducted using the USEPA Maximum Contaminant Level (MCL) of 2 µg/L as the GPS instead of the Montana Human Health Standard (HHS) of 0.2 µg/L. The reasons for this are as follows:

- A data set of 15 to 20 data points can be used when the GPS is set to 2 µg/L.
- The MW-6 and MW-7A data sets incorporating a PQL or MDL of 0.2 µg/L are, at present, too small to conduct meaningful statistical calculations (see **Table 2**).
- Statistical calculations can continue to be performed for vinyl chloride in wells MW-6 and MW-7A while the collection of additional data points at a lower detection limit is ongoing. A GPS of 0.2 µg/L can be used when these data sets are of adequate size for meaningful statistical calculations.

In accordance with ARM 17.50.1307, the statistical analysis was conducted in three steps:

Step 1 - comparison of parameters in samples collected from the background wells (MW-5 and MW-15) and the POC wells (MW-6 and MW-8A) since December 2009.

Step 2 - statistical analysis of parameters in samples collected from the POC wells that are higher than in samples collected from the background wells. In addition, the statistical analysis was conducted on parameters that have exceeded the GPS in the last seven years (since 2005) to determine if there is a statistically significant increase over background values.

Step 3 - statistical examination of trends of those parameters that have exceeded the GPS in the last seven years (since 2005) and if they are significantly greater than the GPS.

Selection and description of the statistical tests employed are described below, as are the results.

#### **4.1 STATISTICAL TEST SELECTION**

Most data in this statistical analysis exhibit non-normal distributions for which non-parametric techniques are appropriate (U.S. EPA, 1992). The demonstration of normality is a three-step process:

- Selection of all data sets with 20 or more data points;
- From the above selection, select those data sets with less than 10 percent non-detected data points; and
- Comparison of the appropriate statistic to a table of critical values at the 95 percent confidence level for all qualified data sets.

In the third step of this process, any result that is below the practical quantitation limit (PQL) or RL is considered to be equal to half of the PQL. In the December 2012 data results lower than the PQL were used and included results between the PQL and MDL. Results less than the MDL considered being equal to the MDL. The MDL is, at a minimum, half of the PQL. This is in accordance with EPA guidelines (U.S. EPA 1992). Only those data sets which meet all three of the above criteria are considered normally distributed in this analysis.

Of the parameters in the December 2012 monitoring that had sufficient sample sizes to test for normality, none exhibited a normal distribution. Hence, where the proportion of non-detects permit, non-parametric techniques were employed. The 1-sample Wilcoxon test is used as the non-parametric equivalent to a parametric confidence interval test (Helsel and Hirsch, 1992).

#### **4.2 STATISTICAL METHODS**

A confidence interval approach is used to compare parameter concentrations in downgradient wells to the GPS. This approach is recommended by U.S. EPA (1989 and 1992) and endorsed by Gibbons, the author of *Statistical Methods for Groundwater Monitoring* (1994). Historical data for the parameters that have equaled or exceeded their GPS on at least a single occasion since 2005 were tested for statistical significance with respect to the GPS using two methods:

- Non-parametric 1-sample Wilcoxon test.
- Parametric 1-sample t-test.

Hypothesis tests, interpretation of results, and data requirements for each of the statistical methods used are discussed below.

#### **4.2.1 Non-Parametric 1-Sample Wilcoxon Test**

This test is a special case of the signed-rank test used to compare the median difference between paired observations. In this case, the paired observations are constituent levels in the compliance well versus the GPS. The null hypothesis is that there is no difference. The alternative hypothesis is that the median of the comparison well is greater than the GPS. A resulting p-value is used to test the significance of the test. The large sample approximation to the test was utilized for sample sets of more than 15 data points. The exact test was used for data sets of seven to 15 observations when the large sample approximation resulted in a p-value less than 0.15. In these instances, p-values were determined from tabulated quantiles for the reported Wilcoxon statistic and sample size. A p-value less than or equal to 0.01 indicates a significant difference exists at the 99 percent confidence level (Helsel and Hirsch, 1992).

A minimum of seven data points are required to employ this non-parametric test at a 99 percent confidence level (U.S. EPA, 1989). In addition, 2 µg/L was considered the GPS for vinyl chloride in the December 2012 monitoring. Non-detect data with a reported PQL above the GPS are discarded in order to avoid misleading results. For non-detect data equal to the GPS, concentration levels are reduced to just below the standard in order to maintain relative ranking among data.

Well MW-6 has exhibited vinyl chloride concentrations above the USEPA GPS of 2 µg/L, in monitoring events conducted between December 2009 and June 2011 (four events). Vinyl chloride concentrations have been below the USEPA GPS in the three sample data sets after June 2011 (December 11, June 2012, and December 2012). There are five valid sample data monitor values with no flag in the past seven years of data sampling (with an additional two values as "J" flag data). Due to data censoring rules for the 1-sample Wilcoxon test, there are an insufficient number of samples for meaningful statistics at station MW-6.

#### **4.2.2 Parametric 1-Sample t-Test**

This test is used to compare the mean difference between paired observations when normality can be demonstrated in the data set. As with the non-parametric case, the paired observations are constituent levels in the compliance well versus the GPS. The null hypothesis is that there is no difference. The alternative hypothesis is that the mean of the comparison well is greater than the GPS. A resulting p-value is used to evaluate the significance of the test. A p-value less than or equal to 0.01 indicates a significant difference exists at the 99 percent confidence level (Helsel and Hirsch, 1992).

Often, water quality data are not normally distributed without mathematical transformation. For those data sets which do not demonstrate normality, a log transformation often applies adequately to water quality data (Helsel and Hirsch 1992) and is also applied to the data sets in this analysis. The test for normality is then performed on the log transformed data. In sample sets containing non-detect data, values one-half the reported PQL (in un-transformed units) are used to replace non-detect data.

#### 4.3 RESULTS

The progression of the statistics calculations were described as Steps 1 through 3 in the beginning of Section 4.0. Results of statistical analyses are summarized in **Tables 3** and **4** and output from statistical analysis including descriptive statistics, data plots, and test results are contained in **Appendix E**.

##### Step 1

A comparison of medians between the upgradient and POC wells was conducted for the last three years of data. Results of this comparison indicated that the following constituents were above background concentrations in one or both of the POC wells:

1,1 dichloroethane  
cis 1,2 dichloroethene  
Tetrachloroethene  
Trichloroethene  
Vinyl Chloride  
N as NO<sub>2</sub>+NO<sub>3</sub>  
Chloride  
Sulfate

##### Step 2

A comparison of medians between the upgradient and POC wells was conducted for the last seven years of data (approximately 15 data points, although up to 20 data points could be used) and results of the Mann-Whitney U test are presented in **Table 3**. Plots and calculations supporting **Table 3** are contained in **Appendix E**. These results indicated that the following constituents were above background concentrations in one or both of the POC wells:

1,1 dichloroethane  
cis 1,2 dichloroethene  
Tetrachloroethene  
Trichloroethene  
Vinyl Chloride  
Chloride  
Sulfate

##### Step 3

Seven statistical tests were performed using the 1-sample Wilcoxon method at the 99 percent confidence level. Results are presented in **Table 4**.

Using the USEPA GPS of 2 µg/L for vinyl chloride, concentrations of vinyl chloride in wells MW-12 and MW-13 were statistically significantly greater than the GPS at the 99 percent confidence level. Vinyl chloride has been detected in these wells since the 1990's.

Although concentrations have increased since 2009, tetrachloroethene in well MW-7A does not exhibit concentrations statistically and significantly greater than the GPS at the 99 percent confidence level. Due to the consideration of sampling results only for the last seven years, trichloroethene in well MW-12 does not exhibit concentrations statistically significantly greater than the GPS at the 99 percent confidence level. In addition, Trichloroethene in well MW-12 exhibits a negative trend over time indicating a decrease in trichloroethene concentrations in this well. The

null hypothesis, that there was no significant difference, was accepted for all other parameters at the 99 percent confidence level.

## 5.0 SUMMARY

The following summarizes data, calculations, and interpretations resulting from the December 2012 groundwater monitoring event at the Bozeman Sanitary Landfill:

- December 2012 groundwater levels were generally consistent with previous monitoring events and indicate a southwest groundwater flow beneath the *Unlined Closed Cell* shifting to a west-southwest flow between the *Lined Closed Cell* and well MW-10.
- Consistent with the results of the June 2012 monitoring event, upward groundwater gradients were measured at MW-6 and MW-8A well locations. Also, consistent with results of previous monitoring events, MW-7 and MW-9 well locations have no upward or downward groundwater gradients down to 74 and 57 feet depths, respectively.
- Tetrachloroethene concentrations ranged between 0.23 (estimated) and 7.7 µg/L in wells LF-2, LF-3, MW-4, MW-6, MW-7A, MW-8A, MW-9A, MW-11, MW-13, MW-16, Landfill Shop Well, and the McIlhattan Seep. Concentrations of vinyl chloride ranged between 1.5 and 21.2 µg/L in wells MW-6, MW-7A, MW-12, and MW-13.
- Tetrachloroethene (in well MW-7A) and vinyl chloride (in wells MW-6, MW-7A, MW-12, and MW-13) exceeded the Montana Human Health Standard and GPS during the December 2012 monitoring event. The concentration of vinyl chloride in well MW-6 has exceeded the Montana Human Health Standard of 0.2 µg/L since December 2009.
- Due to higher analytical reporting limits for vinyl chloride in monitoring results before 2009, the USEPA GPS of 2 µg/L was used in the statistics calculations. Therefore, as of December 2012, the concentration of vinyl chloride in wells MW-12 and MW-13 meet statistics criteria to be significantly greater than the USEPA GPS of 2 µg/L. As of December 2012, vinyl chloride in well MW-6 does not meet statistics criteria to be significantly greater than the USEPA GPS.
- Trichloroethene concentrations ranged between 0.14 (estimated) and 2.1 µg/L in wells LF-2, LF-3, MW-4, MW-6, MW-7A, MW-8A, MW-9A, MW-10, MW-11, MW-13, MW-16, Landfill Shop Well, and the McIlhattan Seep.
- As of December 2012, the concentration of tetrachloroethene and trichloroethene in POC wells did not meet statistics criteria to be significantly greater than the GPS.
- Although statistics calculations indicated that nitrate+nitrite as N in well MW-8A was not statistically above background concentrations or greater than the GPS, nitrate+nitrite as N in well MW-8A has exceeded the GPS for the fifth consecutive monitoring event (since December 2010). The concentration of nitrate+nitrite as N was 16 mg/L in well MW-8A and 3.0 mg/L in well LF-2 (downgradient of well MW-8A).

According to ARM 17.50.1310(5)(b), the City of Bozeman is required to continue corrective actions at the landfill and associated groundwater monitoring until all of the approved constituents in Appendix I to 40 CFR Part 258 contained in ARM 17.50.1306 have not exceeded the GPS for a period of three consecutive years based on statistical analysis of the data. The next corrective measures assessment groundwater monitoring event is scheduled for June 2013.

MP elev change : Measuring point elevation change

DTW : Depth to water below measuring point (feet)

ELEV : Groundwater elevation above mean sea level (feet). Well locations shown on Figure 2.

2 : Approximately 2.4 feet of PVC was added on 7/6/2011

N.M. Not measured

---- Not calculated

**Notes:** µg/L - micrograms per liter

HHS - Human Health Standard (EPA Maximum Contaminant Level or HHS in Montana Circular DEQ-7, October 2012

NA - Not Applicable

J - Estimated Concentration

(1) - No HHS established

-- Not collected/analyzed

U - Below Analytical Reporting Limit

\* (1) X F% - Additional QA/QC notes

  - Value greater than or equal to the HHS

Vinyl Chloride concentration highlighted only if equal to or greater than 2 micrograms per liter (EPA Maximum Contaminant Level). Montana HHS is 0.2 micrograms per liter.

Sulfate	mg/L	14	-	9		15	.000	YES
Sulfate	mg/L	14			14	15	0.682	NO
Sulfate	mg/L	-	37	9	14	15	.000/.000	YES

**Notes:**

Units are in ug/L (micrograms per liter) and mg/L (milligrams per liter)

(1) Sample Size

(2) Mann-Whitney U test at the 99 percent confidence level

(3) Results are significant if the p-value is less than or equal to 0.01 (and Z value is positive in worksheets)

(4) The GPS for vinyl chloride is considered to be 2 ug/L as established by the U.S. EPA and the highest value in the MW 6 data set for vinyl chloride is less than the GPS

**Table 4**  
**Summary of Statistical Analysis of Selected Groundwater Quality Data**  
**Bozeman Sanitary Landfill, Bozeman, Montana**  
**December 2012 Monitoring Event**

Parameter	Well	GPS <sup>(1)</sup>	Test <sup>(2)</sup>	n <sup>(3)</sup>	Test Result (P-value)	Statistically Greater than GPS <sup>(4)</sup>
Nitrate+Nitrite as N	MW-8A	10	1SW	15	0.320	No
Trichloroethene	MW-12	5	1SW	18	0.727	No
Tetrachloroethene	MW-7A	5	1SW	18	0.727	No
Vinyl Chloride	MW-6	2	1SW	18	0.042	No
	MW-7A	2	1SW	18	0.000	No <sup>(5)</sup>
	MW-12	2	1SW	18	0.000	Yes
	MW-13	2	1SW	18	0.000	Yes

**Notes:**

- (1) Groundwater protection standards (GPS) are stated in micrograms per liter ( $\mu\text{g/L}$ ) except Nitrate+Nitrite which is in milligrams per liter. The GPS for vinyl chloride is considered to be 2  $\mu\text{g/L}$  as established by the U.S. EPA
- (2) 1SW indicates a 1-Sample Wilcoxon Test at the 99 percent confidence level; 1ST indicates a 1-Sample t-Test at the 99 percent confidence level
- (3) Sample size after data censoring (further reduction due to the values may occur in 1-Sample Wilcoxon test)
- (4) Results are significant if the p-value is less than or equal to 0.01
- (5) The Wilcoxon test indicated that there is a significant difference between well MW-7A vinyl chloride values and the GPS for vinyl chloride. The difference is due to the fact that well MW-7A vinyl chloride values are lower than the vinyl chloride GPS of 2  $\mu\text{g/L}$

**LABORATORY ANALYTICAL REPORT**

December 19, 2012

Mark Pearson  
Tetra Tech, Inc. - MT  
851 Bridger Dr. Suite 6  
Bozeman, MT 59715

RE: Project: Bozeman Landfill  
Pace Project No.: 10214636

Dear Mark Pearson:

Enclosed are the analytical results for sample(s) received by the laboratory on December 07, 2012. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Samantha Rupe

samantha.rupe@pacelabs.com

## PROJECT NARRATIVE

Project: Bozeman Landfill  
Pace Project No.: 10214636

---

**Method:** **EPA 6020**  
**Description:** 6020 MET ICPMS  
**Client:** Tetra Tech, Inc. - MT  
**Date:** December 19, 2012

### General Information:

1 sample was analyzed for EPA 6020. All samples were received in acceptable condition with any exceptions noted below.

### Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

### Sample Preparation:

The samples were prepared in accordance with EPA 3020 with any exceptions noted below.

### Initial Calibrations (including MS Tune as applicable):

All criteria were within method requirements with any exceptions noted below.

### Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

### Internal Standards:

All internal standards were within QC limits with any exceptions noted below.

### Method Blank:

All analytes were below the report limit in the method blank with any exceptions noted below.

### Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

### Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: MPRP/36912

A matrix spike and matrix spike duplicate (MS/MSD) were performed on the following sample(s): 92140863001

M1: Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

- MS (Lab ID: 1351830)
  - Barium
  - Silver
- MSD (Lab ID: 1351831)
  - Silver

M6: Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

- MS (Lab ID: 1351830)
  - Iron
- MSD (Lab ID: 1351831)
  - Iron
  - Manganese

### Additional Comments:

---

**Method:** **EPA 6020**

**Description:** 6020 MET ICPMS, Dissolved

**Client:** Tetra Tech, Inc. - MT

**Date:** December 19, 2012

**General Information:**

16 samples were analyzed for EPA 6020. All samples were received in acceptable condition with any exceptions noted below.

**Hold Time:**

The samples were analyzed within the method required hold times with any exceptions noted below.

**Sample Preparation:**

The samples were prepared in accordance with EPA 3020 with any exceptions noted below.

**Initial Calibrations (including MS Tune as applicable):**

All criteria were within method requirements with any exceptions noted below.

**Continuing Calibration:**

All criteria were within method requirements with any exceptions noted below.

**Internal Standards:**

All internal standards were within QC limits with any exceptions noted below.

**Method Blank:**

All analytes were below the report limit in the method blank with any exceptions noted below.

**Laboratory Control Spike:**

All laboratory control spike compounds were within QC limits with any exceptions noted below.

**Matrix Spikes:**

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

**Additional Comments:**

---

**Method:** **EPA 8260B**  
**Description:** 8260B MSV Low Level  
**Client:** Tetra Tech, Inc. - MT  
**Date:** December 19, 2012

### General Information:

21 samples were analyzed for EPA 8260B. All samples were received in acceptable condition with any exceptions noted below.

B: Analyte was detected in the associated method blank.  
• LF-2 (Lab ID: 10214636001)

### Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

### Initial Calibrations (including MS Tune as applicable):

All criteria were within method requirements with any exceptions noted below.

### Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

### Internal Standards:

All internal standards were within QC limits with any exceptions noted below.

### Surrogates:

All surrogates were within QC limits with any exceptions noted below.

### Method Blank:

All analytes were below the report limit in the method blank with any exceptions noted below.

### Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

### Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

### Duplicate Sample:

All duplicate sample results were within method acceptance criteria with any exceptions noted below.

### Additional Comments:

Analyte Comments:

QC Batch: MSV/22395

B: Analyte was detected in the associated method blank.  
• LF-2 (Lab ID: 10214636001)  
• Bromomethane

## PROJECT NARRATIVE

Project: Bozeman Landfill  
Pace Project No.: 10214636

**Method:** **EPA 353.2**  
**Description:** 353.2 Nitrate + Nitrite pres.  
**Client:** Tetra Tech, Inc. - MT  
**Date:** December 19, 2012

### General Information:

18 samples were analyzed for EPA 353.2. All samples were received in acceptable condition with any exceptions noted below.

### Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

### Initial Calibrations (including MS Tune as applicable):

All criteria were within method requirements with any exceptions noted below.

### Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

### Internal Standards:

All internal standards were within QC limits with any exceptions noted below.

### Surrogates:

All surrogates were within QC limits with any exceptions noted below.

### Method Blank:

All analytes were below the report limit in the method blank with any exceptions noted below.

### Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

### Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: MT/10914

A matrix spike and matrix spike duplicate (MS/MSD) were performed on the following sample(s): 10214500004,10214636006

M6: Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

- MS (Lab ID: 1349422)
- Nitrogen, NO<sub>2</sub> plus NO<sub>3</sub>

QC Batch: MT/10915

A matrix spike and matrix spike duplicate (MS/MSD) were performed on the following sample(s): 10214636015,10214810001

M6: Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

- MS (Lab ID: 1349432)
- Nitrogen, NO<sub>2</sub> plus NO<sub>3</sub>
- MS (Lab ID: 1349434)
- Nitrogen, NO<sub>2</sub> plus NO<sub>3</sub>

### Duplicate Sample:

All duplicate sample results were within method acceptance criteria with any exceptions noted below.

## QUALIFIERS

Project: Bozeman Landfill  
Pace Project No.: 10214636

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.

H6 Analysis initiated outside of the 15 minute EPA recommended holding time.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

## FULL ANALYSIS

**TABLE 3**  
**BOZEMAN LANDFILL CONSTITUENT LIST FOR ANALYSIS**  
adopted in part from: **CONSTITUENTS FOR DETECTION MONITORING ARM 17.50.1306**  
Appendix I to 40 CFR Part 258 (July 1, 2008)

<u>Inorganic Constituents:</u>	
Antimony	Removed - Do not analyze
Arsenic	
Barium	
Beryllium	Removed - Do not analyze
Cadmium	
Chromium	
Cobalt	
Copper	
Iron	
Lead	
Nickel	
Manganese	
Selenium	
Silver	
Thallium	
Vanadium	
Zinc	
Chloride	
Sulfate	
Nitrate + Nitrite as N	
pH	{only in wells MW-5, MW-6, MW-8A, MW-15}
Specific Conductance	{only in wells MW-5, MW-6, MW-8A, MW-15}

<u>Volatile Organic Constituents:</u>	
Acetone	cis-1,3-Dichloropropene
Acrylonitrile	trans-1,3-Dichloropropene
Benzene	Ethylbenzene
Bromochloromethane	2-Hexanone;Methylbutylketone
Bromodichloromethane	Methylbromide;Bromomethane
Bromoform;Tribromomethane	Methylchloride;Chloromethane
Carbonyl sulfide	Methylenebromide;Dibromomethane
Carbon tetrachloride	Methylenechloride;Dichloromethane
Chlorobenzene	Methylethylketone;MEK;2-Butanone
Chloroethane;Ethylchloride	Methyliodide;Idomethane
Chloroform;Trichloromethane	4-Methyl-2-pentanone;Methylisobutylketone
Dichlorodifluoromethane	Styrene
Dibromochloromethane;Chlorodibromomethane	1,1,1,2-Tetrachloroethane
1,2-Dibromo-3-chloropropane; DBCP	1,1,2,2-Tetrachloroethane
1,2-Dibromoethane; Ethylenedibromide; EDB	Tetrachloroethylene;Tetrachloroethene;Perchloroethylene
o-Dichlorobenzene; 1,2-Dichlorobenzene	Toluene
p-Dichlorobenzene; 1,4-Dichlorobenzene	1,1,1-Trichloroethane;Methylchloroform
trans-1,4-Dichloro-2-butene	1,1,2-Trichloroethane
1,1-Dichlorethane;Ethylidenechloride	Trichloroethylene;Trichloroethene
1,2-Dichlorethane;Ethylenedichloride	Trichlorofluoromethane;CFC-11
1,1-Dichloroethylene;1,1-Dichloroethene;Vinylidenechloride	1,2,3-Trichloropropane
cis-1,2-Dichloroethylene;cis-1,2-Dichloroethene	Vinylacetate
trans-1,2-Dichloroethylene;trans-1,2-Dichloroethene	Vinylchloride
1,2-Dichloropropane;Propylenedichloride	Xylenes

**FULL ANALYSIS**

*Include Metals for Vet Well  
and analyze as total recoverable concentrations*

TABLE 3

BOZEMAN LANDFILL CONSTITUENT LIST FOR ANALYSIS  
adopted in part from: CONSTITUENTS FOR DETECTION MONITORING ARM 17.60.1306  
Appendix I to 40 CFR Part 268 (July 1, 2008)

Inorganic Constituents:	
Antimony - Removed - Do not analyze	Selenium
Arsenic	Silver
Berium	Thallium
Beryllium - Removed - Do not analyze	Vanadium
Cadmium	Zinc
Chromium	
Cobalt	Chloride
Copper	Sulfate
Iron	Nitrate + Nitrite as N
Lead	pH
Nickel	Specific Conductance
Manganese	[only in wells MW-5, MW-6, MW-8A, MW-15]
	[only in wells MW-5, MW-6, MW-8A, MW-15]

Volatile Organic Constituents:	
Acetone	cis-1,3-Dichloropropene
Acrylonitrile	trans-1,3-Dichloropropene
Benzene	Ethylbenzene
Bromochloromethane	2-Hexanone;Methylbutylketone
Bromodichloromethane	Methylbromide;Bromomethane
Bromoform;Tribromomethane	Methylchloride;Chloromethane
Carbonylsulfide	Methylenebromide;Dibromomethane
Carbon tetrachloride	Methylenechloride;Dichloromethane
Chlorobenzene	Methylethylketone;MEK;2-Butanone
Chloroethane;Ethylchloride	Methyliodide;Dimethylane
Chloroform;Trichloromethane	4-Methyl-2-pentanone;Methylisobutylketone
Dichlorodifluoromethane	Styrene
Dibromochloromethane;Chlorodibromomethane	1,1,1,2-Tetrachloroethane
1,2-Dibromo-3-chloropropane;DBCP	1,1,2,2-Tetrachloroethane
1,2-Dibromoethane; Ethylenedibromide; EDB	Tetrachloroethylene;Tetrachloroethene;Perchloroethylene
o-Dichlorobenzene; 1,2-Dichlorobenzene	Toluene
p-Dichlorobenzene; 1,4-Dichlorobenzene	1,1,1-Trichloroethane;Methylchloroform
trans-1,4-Dichloro-2-butene	1,1,2-Trichloroethane
1,1-Dichlorethane;Ethylidenechloride	Trichloroethylene;Trichloroethene
1,2-Dichlorethane;Ethylenedichloride	Trichlorofluoromethane;CFC-11
1,1-Dichloroethylene;1,1-Dichloroethene;Vinylidenechloride	1,2,3-Trichloropropane
cis-1,2-Dichloroethylene;cis-1,2-Dichloroethene	Vinylacetate
trans-1,2-Dichloroethylene;trans-1,2-Dichloroethene	Vinylchloride
1,2-Dichloropropane;Propylenedichloride	Xylenes

## PARTIAL ANALYSIS

**TABLE 5**  
**BOZEMAN LANDFILL CONSTITUENT LIST FOR ANALYSIS**  
 adopted in part from: **CONSTITUENTS FOR DETECTION MONITORING ARM 17.50.1306**

variable	Mann-Whitney U Test (2012-12 MW8ATCEvBKGND) By variable WELL8A-15 Marked tests are significant at p <.01000									
	Rank Sum MW-8A	Rank Sum MW-15	U	Z	p-value	Z adjusted	p-value	Valid N MW-8A	Valid N MW-15	2*1sided exact p
	358.5000	137.5000	17.50000	4.031904	0.000055	4.097698	0.000042	16	15	0.000008

### Mann Whitney - MW 8A VC Vs Background

Variable	Descriptive Statistics (2012-12 MW8AVCvBKGND)					
	Valid N	Mean	Median	Minimum	Maximum	Std.Dev.
VC8A	15	0.210967	0.250000	0.024500	0.500000	0.143227
VC5	15	0.210967	0.250000	0.024500	0.500000	0.143227
VC15	15	0.210967	0.250000	0.024500	0.500000	0.143227

variable	Mann-Whitney U Test (2012-12 MW8AVCvBKGND) By variable WELL8A-5 Marked tests are significant at p <.01000									
	Rank Sum MW-8A	Rank Sum MW-5	U	Z	p-value	Z adjusted	p-value	Valid N MW-8A	Valid N MW-5	2*1sided exact p
VC8A-5	231.0000	234.0000	111.0000	-0.041478	0.966915	-0.043018	0.965687	15	15	0.967417

variable	Mann-Whitney U Test (2012-12 MW8AVCvBKGND) By variable WELL8A-15 Marked tests are significant at p <.01000									
	Rank Sum MW-8A	Rank Sum MW-15	U	Z	p-value	Z adjusted	p-value	Valid N MW-8A	Valid N MW-15	2*1sided exact p
VC8A-15	231.0000	234.0000	111.0000	-0.041478	0.966915	-0.043018	0.965687	15	15	0.967417
